

## Phase Unbalance & Loss Monitor

### DIMENSIONS (INCHES)

### WIRING

The **SLC Series** is designed to protect 3-phase equipment against Phase **UNBALANCE** and **PHASE LOSS** conditions.

### OPERATION

With normal operating voltages applied to all three phases, the internal relay will remain de-energized (**DROPPED-OUT**).

When a Phase Loss or Phase Unbalance exceeding the pre-selected trip point occurs, the relay will energize (**PICK-UP**). The SLC series is typically used in conjunction with a **SHUNT TRIP BREAKER**.

Both Delta and Wye systems may be monitored. In Wye systems, connections to neutral are not required.

**NOTE:** When a phase is lost while the motor is running, a condition known as regeneration occurs where a voltage is induced into the open phase nearly equal in magnitude to the normal phase-to-phase voltage. The SLC series is designed to detect this condition when properly adjusted.
