

DC-DC CONVERTER 6W, Regulated Output, DIP Package

FEATURES

- Smallest Encapsulated 6W Converter
- Industrial Standard DIP-16 Package
- Ultra-wide 4:1 Input Voltage Range
- Fully Regulated Output Voltage
- I/O Isolation 1500 VDC
- ► Operating Temp. Range -40°C to +90°C
- Low No Load Power Consumption
- No Min. Load Requirement
- Under-voltage, Overload and Short Circuit Protection
- Shielded Metal Case with Insulated Baseplate
- Conducted EMI EN 55032 Class A Approved
- UL/cUL/IEC/EN 62368-1(60950-1) Safety Approval & CE Marking

PRODUCT OVERVIEW

As the smallest encapsulated 6 Watt industrial DC DC converter, MDWI06 series features low no load power consumption, fully regulated output voltage, and a shielded metal case with an insulated baseplate, able to provide up to 87% efficiency and instantaneous load capacity. In recent years, MDWI06 series 6 Watt DC-DC power converters are widely used in motion controllers, charging piles, and other industrial-grade applications.

The MDWI06 series offers 7 output voltage options, including 3.3V, 5V, 12V, 15V, 24V, \pm 12V, and \pm 15V, providing a total of 14 selectable models. With a wide 4:1 input voltage range, it enhances versatility for various application scenarios. The MDWI06 features advanced circuit topology, regardless of changes in internal or external conditions, it maintains high stability in overall efficiency, power loss, and heat generation. The series supports a working temperature range from -40°C to +90°C.

For a more relieving experience, MINMAX DC DC converter manufacturer puts various safety guard functions for MDWI06 series such as under-voltage, overload, and short circuit protection. When it comes to certifications, it also has UL/cUL/IEC/EN 62368-1(60950-1) Safety Approval & CE marking so that you can rely on MINMAX products!

Model	Input	Output	Output	Inp	out	Max. capacitive	Efficiency

DC-DC CONVERTER 6W, Regulated Output, DIP Package

Environmental Specifications

Parameter	Min.	Max.	Unit		
Operating Ambient Temperature Range (See Power Derating Curve)	-40	+90	°C		
Case Temperature		+105	°C		
Storage Temperature Range	-50	+125	°C		
Humidity (non condensing)		95	% rel. H		
Lead Temperature (1.5mm from case for 10Sec.)		260	°C		

Power Derating Curve

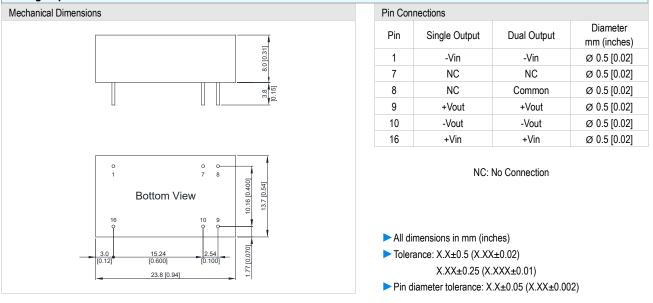

Notes

- 1 Specifications typical at Ta=+25°C, resistive load, nominal input voltage and rated output current unless otherwise noted.
- 2 Transient recovery time is measured to within 1% error band for a step change in output load of 75% to 100%.
- 3 We recommend to protect the converter by a slow blow fuse in the input supply line.
- 4 Other input and output voltage may be available, please contact MINMAX.
- 5 The external components might be required to meet EMI/EMS standard for some of test items. Please contact MINMAX for the solution in detail.
- 6 Specifications are subject to change without notice.
- 7 The repeated high voltage isolation testing of the converter can degrade isolation capability, to a lesser or greater degree depending on materials, construction, environment and reflow solder process. Any material is susceptible to eventual chemical degradation when subject to very high applied voltages thus implying that the number of tests should be strictly limited. We therefore strongly advise against repeated high voltage isolation testing, but if it is absolutely required, that the voltage be reduced by 20% from specified test voltage. Furthermore, the high voltage isolation capability after reflow solder process should be evaluated as it is applied on system.

Physical Characteristics

Case Size	: 23.	8x13.7x8.0 mm (0.94x0.54x0.31 inches)
Case Material	: Me	tal With Non-Conductive Baseplate
Pin Material	: Co	pper Alloy
Weight	: 6.1	g

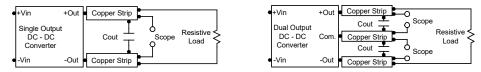

DC-DC CONVERTER 6W, Regulated Output, DIP Package

Test Setup

Peak-to-Peak Output Noise Measurement Test

Use a Cout 0.47µF ceramic capacitor. Scope measurement should be made by using a BNC socket, measurement bandwidth is 0-20 MHz. Position the load between 50 mm and 75 mm from the DC-DC Converter.

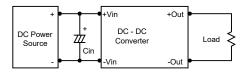

Technical Notes

Overload Protection

To provide protection in a fault (output overload) condition, the unit is equipped with internal current limiting circuitry and can endure current limiting for an unlimited duration. At the point of current-limit inception, the unit shifts from voltage control to current control. The unit operates normally once the output current is brought back into its specified range.

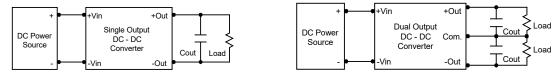

Input Source Impedance

The power module should be connected to a low ac-impedance input source. Highly inductive source impedances can affect the stability of the power module. In applications where power is supplied over long lines and output loading is high, it may be necessary to use a capacitor at the input to ensure startup. Capacitor mounted close to the power module helps ensure stability of the unit, it is recommended to use a good quality low Equivalent Series Resistance (ESR < 1.0Ω at 100 kHz) capacitor of a 2.2µF for the 24V and 48V devices.

Output Ripple Reduction

A good quality low ESR capacitor placed as close as practicable across the load will give the best ripple and noise performance. To reduce output ripple, it is recommended to use 3.3µF capacitors at the output.

Maximum Capacitive Load

The MDWI06 series has limitation of maximum connected capacitance at the output. The power module may be operated in current limiting mode during start-up, affecting the ramp-up and the startup time. The maximum capacitance can be found in the data sheet.

Thermal Considerations

Many conditions affect the thermal performance of the power module, such as orientation, airflow over the module and board spacing. To avoid exceeding the maximum temperature rating of the components inside the power module, the case temperature must be kept below 105°C. The derating curves are determined from measurements obtained in a test setup.
